Release v0.0

Mateus Piovezan Otto

Dec 07, 2019

CONTENTS:

1	Getting started to <i>Sphinx</i>	1
1.1	Documenting objects	1
2	Indices and tables	3

GETTING STARTED TO *SPHINX*

The syntax is pretty much like *Markdown*. Are them related?

1.1 Documenting objects

enumerate (*sequence* [, *start=0*])

Return an iterator that yields tuples of an index and an item of the *sequence*. (And so on.)

the `enumerate()` function can be used for ...

Referencing `io.open()`

1.1.1 Testing some headings

```
class xtalphases.data.preprocess.CIFParser (filename, cif_columns=['index_h', 'index_k',
                                                                    'index_l', 'FOBS', 'SIGFOBS', 'UOBS',
                                                                    'SIGUOBS', 'FC', 'PHI', 'FOM', 'RESOL',
                                                                    'pdbx_r_free_flag'])
```

get_pdb_name ()

Get PDB_ID of the file being parsed.

Returns name

Return type PDB_ID of the file being parsed.

header_parse ()

Parse numeric and textual info on .cif header.

header_refl_df (*headercols=None, reflncols=None, phierror=False*)

Convert header and reflection into a single DataFrame. Header and reflections columns can be specified via *headercols* and *reflncols* arguments.

Parameters

- **headercols** (header columns to be included in the final DataFrame.) –
- **reflncols** (reflection columns to be included in the final DataFrame.) –

Returns header_refl_df

Return type DataFrame containing both header and reflection info.

header_to_df (*columns=None*)

Convert header dictionary to a pandas DataFrame.

Returns

- **cifheader_df** (*pandas DataFrame containing all information*)
- *stored on the header dictionary.*

header_to_series (*columns=None*)

Convert header dictionary to a pandas Series.

Returns

- **cifheader_series** (*pandas Series containing all information*)
- *stored on the header dictionary.*

parse (*integer_indexes=['index_h', 'index_l', 'index_k', 'pdbx_r_free_flag']*)

Parse both header and reflections.

reflections_parse (*integer_columns=['index_h', 'index_l', 'index_k', 'pdbx_r_free_flag']*)

Parse reflections on .cif file.

Parameters

- **integer_indexes** (*reflection columns containing*) –
- **entries.** (*integer*) –

reflections_to_df (*columns=None*)

Convert reflection dictionary to a pandas DataFrame.

Returns

- **refln_df** (*pandas DataFrame containing all information*)
- *stored on the reflection dictionary.*

class `astroph.random_code.FaradayRotation` (*polarization_angles*)

A class for Faraday Rotation measurements to determine interstellar magnetic fields.

Parameters **polarization_angles** (*array*) – Polarization angle measurements.

`astroph.random_code.FaradayRotation._get_magnetic_field_map` (*self*)

Testing math docstring.

Returns **map** – Array representing the magnetic field map. Here $\alpha < \beta$.

Return type `array`

$$B = \frac{\mu_0}{4\pi}$$

```
>>> import math
>>> math.sqrt(2.)
1.4142135623730951
```

INDICES AND TABLES

- `genindex`
- `modindex`
- `search`

INDEX

`_get_magnetic_field_map()` in `module astroph.random_code.FaradayRotation`, 2

`CIFParser` class in `xtalphases.data.preprocess`, 1

`enumerate()` built-in function, 1

`FaradayRotation` class in `astroph.random_code`, 2

`get_pdb_name()` `xtalphases.data.preprocess.CIFParser` method, 1

`header_parse()` `xtalphases.data.preprocess.CIFParser` method, 1

`header_refl_df()` `xtalphases.data.preprocess.CIFParser` method, 1

`header_to_df()` `xtalphases.data.preprocess.CIFParser` method, 1

`header_to_series()` `xtalphases.data.preprocess.CIFParser` method, 2

`parse()` `xtalphases.data.preprocess.CIFParser` method, 2

`reflections_parse()` `xtalphases.data.preprocess.CIFParser` method, 2

`reflections_to_df()` `xtalphases.data.preprocess.CIFParser` method, 2
